Sad to know that GSLV failed again. Its more serious because this is the 2nd GSLV failure in 6 months. This is gonna Delay Chandrayaan2.

Cairo Dock for inux is too cool. Wish a full fledged opensource dock exit for Windows. Rocketdock is the closest I can get.

How to run KMyMoney in Windows

One of my favorite software in Linux/KDE is KMyMoney. It's an excellent money managing and budgeting software (similar to Quicken on windows). However, It does not have a port on Windows. So when I am in office, where I use windows I wont be able to use the software. KDE is planning to port it to windows when the KDE4 version of Kmmoney is complete. (currently Kmmoney uses KDE3 libs).

However there is a simple way to run Kmmoney on windows. All you need to do is run Andlinux (runs Linux natively in windows) in windows and launch the app. Its a generic solution to run any Linux app in windows. Here is how it works

- 1) Download the Andlinux from [here](#).
- 2) The installation is similar to other windows app. The installation details provided [here](#) is quite comprehensive.
- 3) After installing, restart your Windows and you should be able to see the KDE menu icon in the system tray. If you had chosen to start Andlinux through command line then start it using the startup.bat batch file. (Don't be confused if my system tray looks different from regular Windows system tray because I don't use the regular one. I had replaced it with a open source system tray called Geoshell)

- 4) The default installation will not have Kmmoeoy in the menu. (The above snapshot was taken after installing it). To install it open Konsole and type
`sudo apt-get install kmymoney2`

If it prompts for the password, enter it. Now Kmmoney will get installed. After installation type 'kmymoney2' on the konsole to launch the Kmmoney.

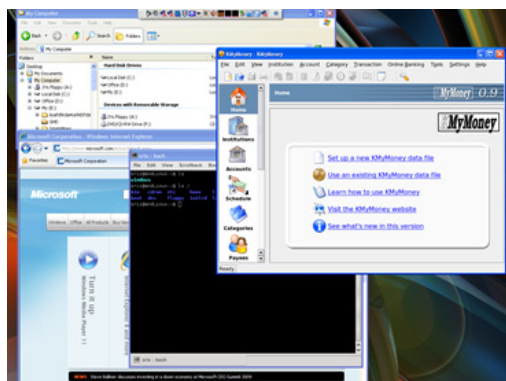

- 5) To add it to the Kmenu list do the following. Open the [install path]/andlinux/launcher/menu.txt. Add the following line to the file.

KMyMoney;kmymoney.ico;kmymoney2

Right click and download the kmymoney.ico from [here](#) and save it to the [install path]/andlinux/launcher/ folder. Close the current Kmenu by selecting the exit option at the bottom. Relaunch it by running [install path]/andlinux/launcher/menu.exe

That is all and now you have KmyMoney on Windows.

Mounting USB on AndLinux

If you are carrying the .kmy file in a USB, then you may need to mount the USB to edit the file in Kmmoney running on Andlinux. Let me explain that here.

Open the [install path]/andlinux/settings.txt and add the following line

sda1=\\Device\\Harddisk1\\Partition0
